

# How to create a Rescue Media ISO image file

If you have problems burning optical media with the built-in Macrium Reflect optical media burning engine then you can easily create a standard ISO format image file that can be used with any DVD/CD burning software to create your rescue media,

Select the **Other Tasks** menu and then select **Create Rescue Media**.

The **Macrium Rescue Media Builder** dialog will open:

Select **ISO File** then enter the file name and click **Build**.

You can then use most DVD burning software, such as the free [ImgBurn](#) to create your physical media.
